
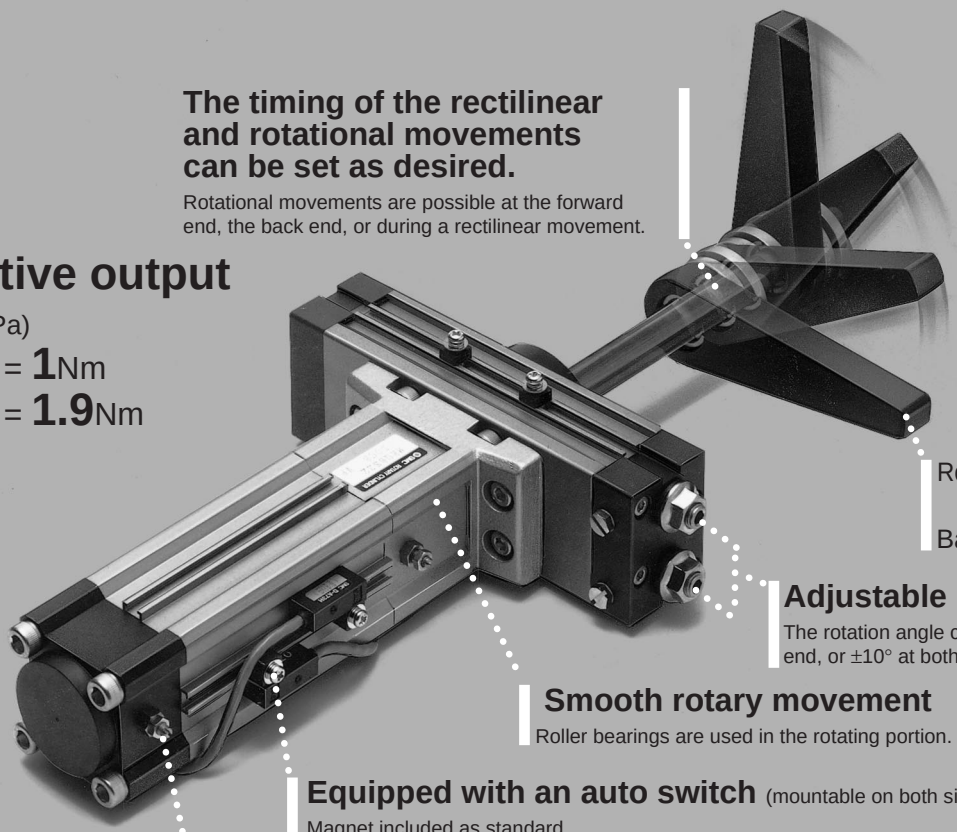
Rotary Cylinder
Series MRQ
Size: 32, 40

A rectilinear rotation unit that compactly integrates a slim cylinder and a rotary actuator.



The timing of the rectilinear and rotational movements can be set as desired.

Rotational movements are possible at the forward end, the back end, or during a rectilinear movement.

Effective output

(At 0.5MPa)

Size 32 = **1**Nm

Size 40 = **1.9**Nm

Rotation angle: **80° to 100°**
170° to 190°

Backlash: Within 2°

Adjustable rotation angle

The rotation angle can be adjusted ±5° at each end, or ±10° at both ends.

Smooth rotary movement

Roller bearings are used in the rotating portion.

Equipped with an auto switch (mountable on both sides)

Magnet included as standard.

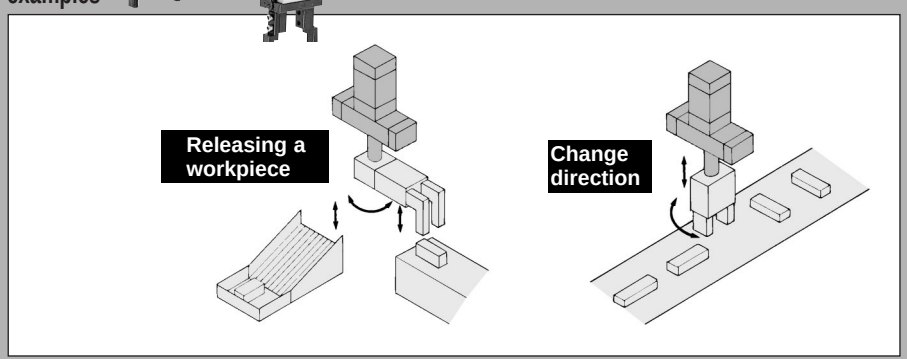
(Reed switch: D-A7/A8,
Solid state switch: D-F7/J7)

An air cushion is also available.

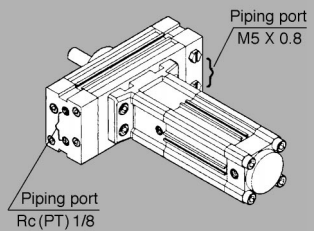
Series MRQ

Linear motion part size	Output of rotating part (at 0.5MPa)	Rotation angle	Linear motion stroke (mm)									
			5	10	15	20	25	30	40	50	75	100
32	1.02N/m	80° to 100°	●	●	●	●	●	●	●	●	●	
		170° to 190°	●	●	●	●	●	●	●	●	●	
40	1.91N/m	80° to 100°	●	●	●	●	●	●	●	●	●	
		170° to 190°	●	●	●	●	●	●	●	●	●	

Application examples



A connecting port can be selected from two positions that are available on the rotation unit.



Connecting ports are provided "IN" two positions as standard specifications.

Data❶
How to Set Rotation Time

Unit Conversions

SI units are used in this catalog. The unit conversion between SI and conventional units are as follows:

Pressure	1MPa	= 10.1972kgf/cm^2	Oscillation acceleration 100m/s^2 = 10.1972G
Cylinder thrust/load	100N	= 10.1972kgf	Standard air: Symbol (ANR)
Torque	1Nm	= 10.1972kgfcm	Temperature 20°C {293K}, Air with
Moment of inertia	1kgm^2	= 10.1972kgcm/s^2	an absolute pressure of 760 mmHg
Kinetic energy	1J	= 10.1972kgcm	{101.3kPa}, and a relative humidity of 65%

Allowable Kinetic Energy

Even if the torque that is required by the load in the rotation movement is small, the internal parts could become damaged depending on the inertia of the load. Therefore, select an appropriate model for your application by taking the load's moment of inertia, kinetic energy, and rotation time into consideration. (A chart that depicts the moments of inertia and the rotation time is provided to facilitate the selection process.)

1 Setting of Rotation Time

Set the rotation time within the adjustable rotation time range that ensures stable operation, based on the table on the right. Setting the speed higher than the upper limit could cause the actuator to stick or slip.

Size	Allowable kinetic energy (J)	Adjustable rotation time range that ensures stable operation
32	0.023	0.2 to 1
40	0.028	0.2 to 1

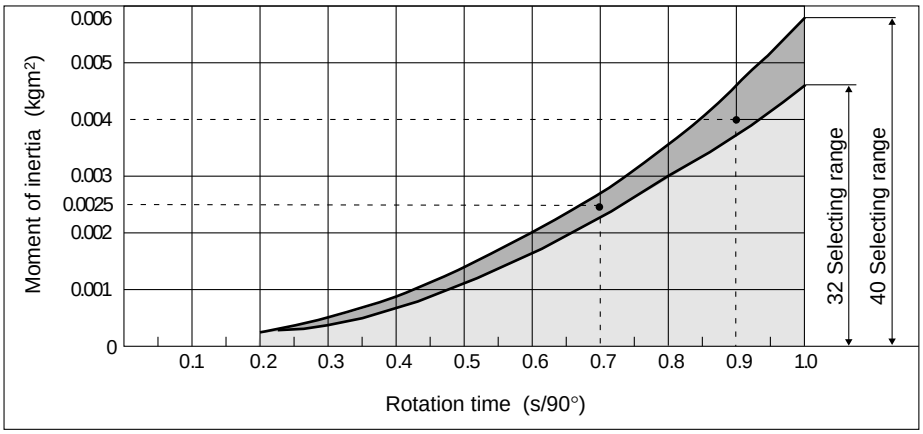
2 How to Calculate Moment of Inertia

Formula of moment of inertia is subject to load shape. Refer to the moment of inertia formula on p.1.5-3.

3 Selection of a Model

Select a model by applying the calculated moment of inertia to the chart below.

Moment of inertia and rotation time



〈**How to read graph**〉

● Moment of inertia·····0.0025kgm^2 ● Rotation time·····0.7S/90°, size 40 will be selected.

〈**Calculation example**〉

Load shape: Column with a radius of 0.2m and a weight of 0.2kg Rotation time: 0.7s/90°

$$I = 0.2 \times \frac{0.2^2}{2} = 0.004 \text{kgm}^2$$

In the chart that depicts the moment of inertia and the rotation time, find the intersecting point of the lines that extend from the locations corresponding to 0.004kg/m^2 on the vertical axis (moment of inertia) and to 0.9s/90° on the horizontal axis (rotation time). Select size 40 because the intersecting point is found within the selection range for size 40.

How to calculate the load energy

$$E = \frac{1}{2} I\omega^2, \ \omega = \frac{2\theta}{t}$$

E: Kinetic energy·····(J)
I: Moment of inertia···(kgm^2)
ω^*: Angular velocity·····(rad/s)
θ: Rotation angle·····(rad)
180° = 3.14rad
t: Rotation time·····(s)

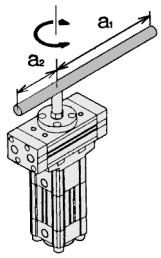
∗The ω that is obtained here is the terminal angular velocity of an isometric acceleration movement.

Data❷
Moment of Inertia

4 Calculation of moment of inertia I (I: Moment of Inertia (kgm²) m: Load weight (kg))

❶Thin rod

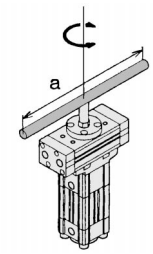
Position of rotation axis: Perpendicular to the piston rod and passes through center line.



$$I = m_1 \frac{a_1^2}{3} + m_2 \frac{a_2^2}{3}$$

❷Thin rod

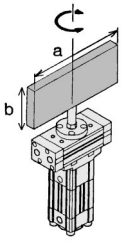
Position of rotation axis: Perpendicular to the rod and passes through the center of gravity.



$$I = m \frac{a^2}{12}$$

❸Thin rectangle board (Parallelogram)

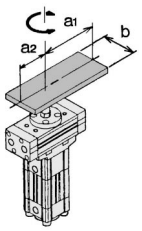
Position of rotation axis: Parallel to side b and passes a center of gravity.



$$I = m \frac{a^2}{12}$$

❹Thin rectangle board (Parallelogram)

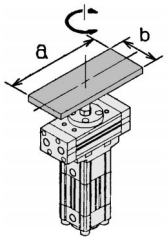
Position of rotation axis: Perpendicular to the board and passes through center line.



$$I = m_1 \frac{4a_1^2+b^2}{12} + m_2 \frac{4a_2^2+b^2}{12}$$

❺Thin rectangle board (Parallelogram)

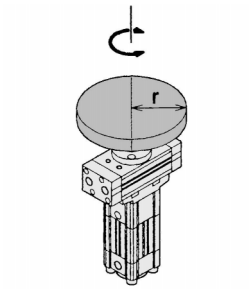
Position of rotation axis: Passes through center of gravity and perpendicular to the board. (Same formula regardless of board thickness.)



$$I = m \frac{a^2+b^2}{12}$$

❻Column (Including discs)

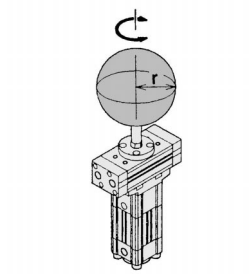
Position of rotation axis: Center axis.



$$I = m \frac{r^2}{2}$$

❼Sphere

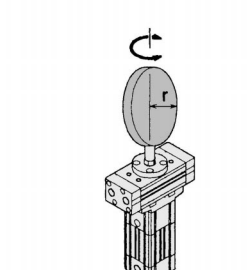
Position of rotation axis: Sphere centered about axis of rotation.



$$I = m \frac{2r^2}{5}$$

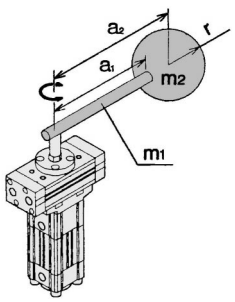
❽Disc

Position of rotation axis: Disc centered about axis of rotation.



$$I = m \frac{r^2}{4}$$

❾With a load at the lever end

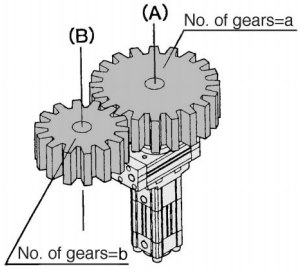


$$I = m_1 \frac{a_1^2}{3} + m_2 a_2^2 + K$$

Ex.) Referring to case ⑦ where "W2" is a sphere,

$$K = m_2 \frac{2r^2}{5}$$

❿Gear transmission



1. Find moment of inertia I_B around the rod (B).
2. Replace moment of inertia I_B around the rod (A) with I_A, $I_A = (\frac{a}{b})^2 I_B$

Data❸
Theoretical Output

5 Linear Motion Part Theoretical Output

Linear motion Part theoretical output table

Unit: N

Size	Rod diameter (mm)	Operating direction	Piston area (mm^2)	Operating pressure (MPa)						
				015	0.2	0.3	0.4	0.5	0.6	0.7
32	12.2	OUT	804	121	161	241	322	402	482	563
		IN	675	101	135	202	270	337	405	472
40	14.2	OUT	1256	183	251	377	502	628	754	879
		IN	1081	162	216	324	433	541	649	757

(Formula) Thrust (N) = Piston area (mm^2) x Operating pressure (MPa)

Generation power from the linear motion part

Calculation formula

$F_1 = \eta \times A_1 \times P$ ..... (1)

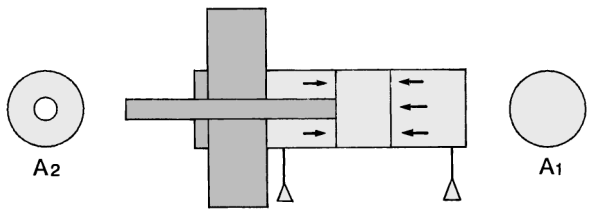
$F_2 = \eta \times A_2 \times P$ ..... (2)

$A_1 = \frac{\pi}{4} D^2$ ..... (3)

$A_2 = \frac{\pi}{4} (D^2 - d^2)$ ..... (4)

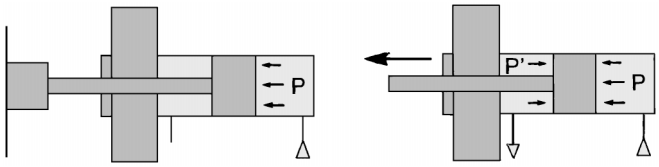
F_1 = Cylinder force generated on the extending side (N)
F_2 = Cylinder force generated on the retracting side (N)
η = Load rate
A_1 = Piston area on the extending side (mm^2)
A_2 = Piston area on the retracting side (mm^2)
D = Tube bore size (mm)
d = Piston rod diameter (mm)
P = Operating pressure (MPa)

Note) As shown in the diagram below, the retracting side pressure surface area of the double acting single rod cylinder is reduced by the area that corresponds to the piston rod's cross sectional area.



Load rate η

In the process of selecting an appropriate cylinder, remember that there are sources of resistance other than the load that apply in the output direction. Even at a standstill as shown in the diagram below, the resistance that is incurred by the seals or bearings in the cylinder must be subtracted. Furthermore, during operation, the reactive force that is created by the exhaust pressure also acts as resistance.



While not operated While operated

Because resistance that counters the cylinder output vary with conditions such as the cylinder size, pressure, and speed, it is necessary to select an air cylinder of a greater capacity. For this purpose, the load ratio is used; make sure that the load ratio values listed below are obtained when selecting an air cylinder.

1) Using the cylinder for stationary operation: load ratio η = 0.7 (Fig. 1)
2) Using the cylinder for dynamic operation: load ratio η = 0.5 (Fig. 2)
3) Using a guide type for horizontal operation: load ratio η = 1 (Fig. 3)

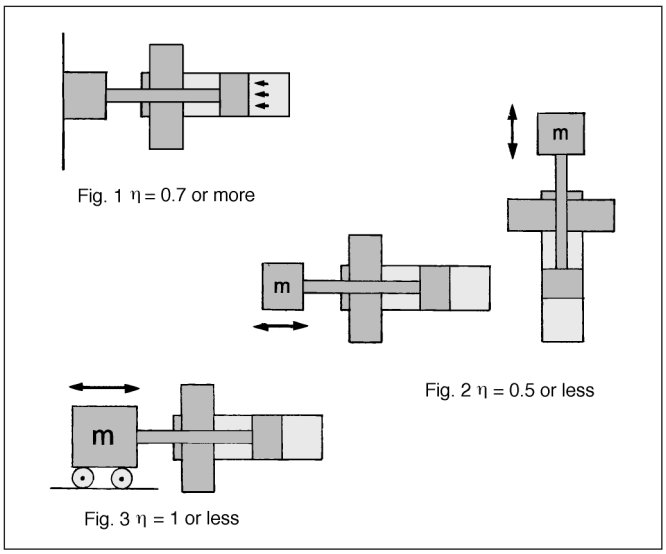


Fig. 1 η = 0.7 or more

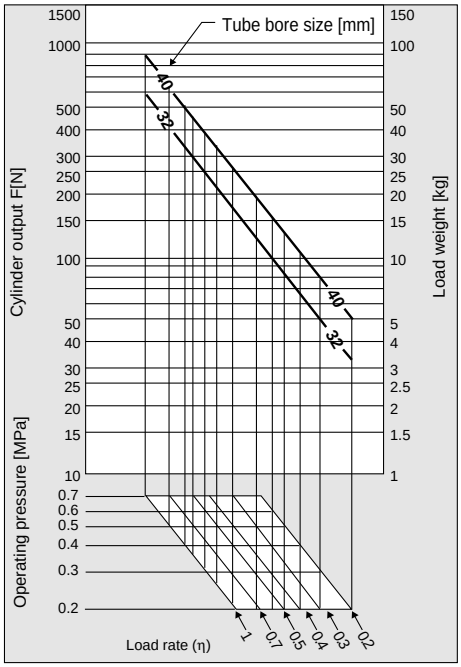
Fig. 2 η = 0.5 or less

Fig. 3 η = 1 or less

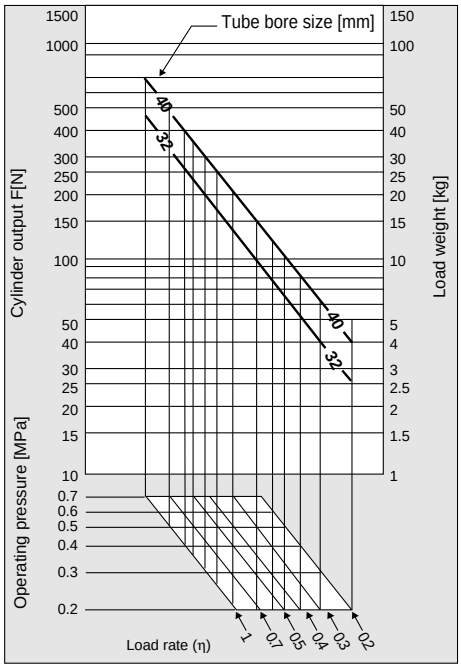
Note) For dynamic operation, the load ratio may be set even lower if it is particularly necessary to operate the cylinder at high speeds. Setting it lower provides a greater margin in the cylinder output, thus enabling the cylinder to accelerate more quickly.

Data ❸
Theoretical Output/Side Load/Allowable Moment

⟨Graph 1⟩ Cylinder output on the extending side (Double acting)



⟨Graph 2⟩ Cylinder output on the retracting side (Double acting)



How to read graph

① Decide on the direction in which the cylinder output will be used (the extension or the retraction side). (See graph 1 for the extension side, and graph 2 for the retraction side.)

② Find the point at which the load ratio (diagonal line) and the operating pressure (horizontal line) intersect. Then, extend a vertical line from that point. (Determine the load ratio η in accordance with the load ratio η that has been determined on p.1.5-4.)

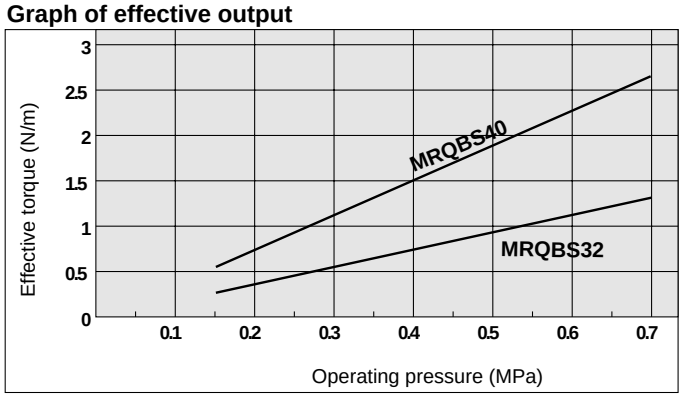
③ Extend a horizontal line from the necessary cylinder output (left diagram), and find the point at which it intersects with the vertical line of ②. The diagonal line above that intersecting point represents the inner diameter of the tube that can be used.

6 Theoretical Output of the Rotating Part

Table of Theoretical Output of the Rotating Part Unit: Nm

Size	Operating pressure (MPa)						
	0.15	0.3	0.3	0.4	0.5	0.6	0.7
32	0.34	0.45	0.68	0.9	1.13	1.36	1.58
40	0.64	0.85	1.27	1.7	2.12	2.54	2.97

Graph of effective output

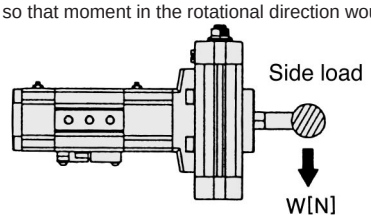


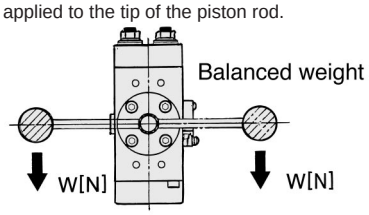
7 The allowable lateral load and the moment at the tip of the piston rod

An excessive amount of lateral load or moment applied to the piston rod could cause a malfunction or internal damage. The allowable load range varies by conditions such as the installed orientation of the cylinder body or whether an arm lever is attached to the tip of the piston rod. Find the allowable value from the diagram shown below and operate the rotary cylinder within that value.

1) Using the cylinder body installed horizontally:

To operate the rotary cylinder with the cylinder body installed horizontally, make sure that the total load that is applied to the tip of the piston rod will be within the value indicated in the table below. If the center of gravity of the total load is not in the center of the shaft, provide a balance weight as illustrated below so that moment in the rotational direction would not be applied to the tip of the piston rod.





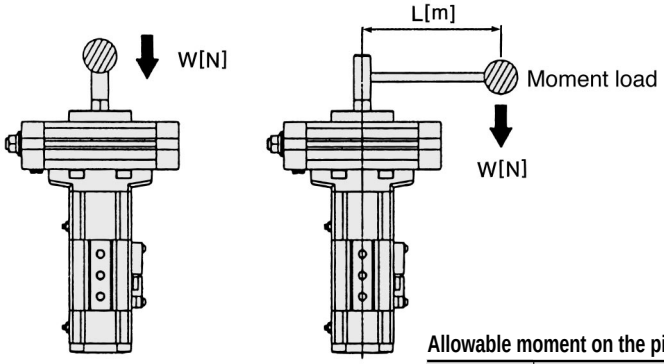
Allowable side load on the piston end Unit: N

Size	Stroke of linear part									
	5	10	15	20	25	30	40	50	75	100
32	14	14	13	13	13	12	12	11	10	9
40	23	23	22	21	21	20	19	18	16	15

2) Using the cylinder body installed vertically:

To operate the rotary cylinder with the cylinder body installed vertically, the total load that is applied to the tip of the piston rod must be within the thrust of the rectilinear portion in which the load ratio is taken into consideration. (Refer to p.1.5-4 for further information on load rate.)

If the center of gravity of the total load is not in the center of the shaft, it is necessary to calculate the moment. Make sure that the moment is within the value shown in the table below.



Affecting moment to the piston rod end
Moment = W X L [Nm]

Allowable moment on the piston rod end

Size	Regardless of the stroke
32	2.128 [Nm]
40	3.844 [Nm]

Data 4
Air Consumption

8 Air Consumption

Results are determined by measuring the factors through 1 complete cycle over one minute.

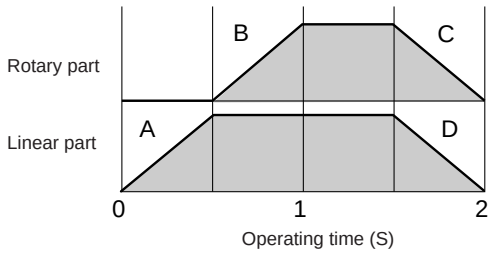
Data 5
Air Requirements

9 Air Requirements

The required air volume, which is the amount of air that is required for operating the rotary cylinder at the prescribed speed, is necessary for selecting the F.R.L. equipment or the pipe size.
The amount of air requirement of rotary actuator = 0.06 x V x (P/0.1013)/t ℓ/min(ANR)
V: Inner volume = cm^3
P: Absolute pressure = {Operating pressure (MPa) + 0.1013}
t: Operating time = s

Calculate the required air volume separately for the linear motion part and the rotary motion part. The required air volume for operating the linear motion and rotary motion parts simultaneously is the total of the individually obtained values.
Calculation example: Obtain the required air volume to be used from the operation chart shown below.

Model: MRQBS32-50CA-A73 Operating pressure: 0.5MPa



Calculate the amount of air requirement for A, B, C and D respectively.
A = 0.06 X 40.2 X {(0.5 + 0.1013)/0.1013}/0.5 = 28.6 ℓ/min
B = 0.06 X 4.88 X {(0.5 + 0.1013)/0.1013}/0.5 = 3.5 ℓ/min
C = B = 3.5 ℓ/min
D = 0.06 X 33.7 X {(0.5 + 0.1013)/0.1013}/0.5 = 24 ℓ/min
Since operation is simultaneous at C and D, total the respective amounts of air requirement.
C + D = 3.5 + 24 = 27.5 ℓ/min

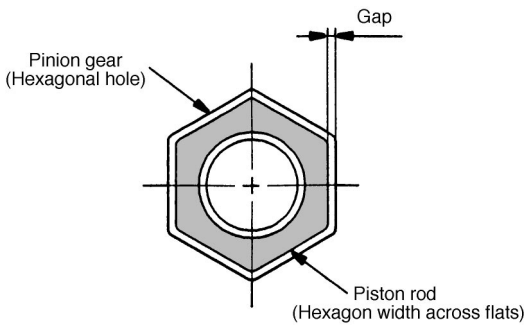
40	ETP-K-14	MA14 X 28	CLH-14 X 23

∗Consult the manufacturers concerning further information like on specifications.

Size	Adjusting angle per 1 rotation of angle adjusting screw
32	5.7°
40	4.8°

Backlash

The rotary motion part has a double-rack construction. The pinion gear has a hexagonal hole, and a slight clearance exists between this hole and the hexagonal flats of the piston rod. This clearance generates a backlash in the rotational direction of the piston rod.



⚠ Precaution

Be sure to read before handling. Refer to p.0-20 and 0-21 concerning Safety Instructions and common precautions on the products mentioned in this catalog, and p.1.0-2 to 1.0-4 concerning common precautions for respective series.

⚠ Caution

The angle adjustment bolt is adjusted to a random position within the adjustable rotating range. Therefore, it must be readjusted to obtain the angle that suits your application.

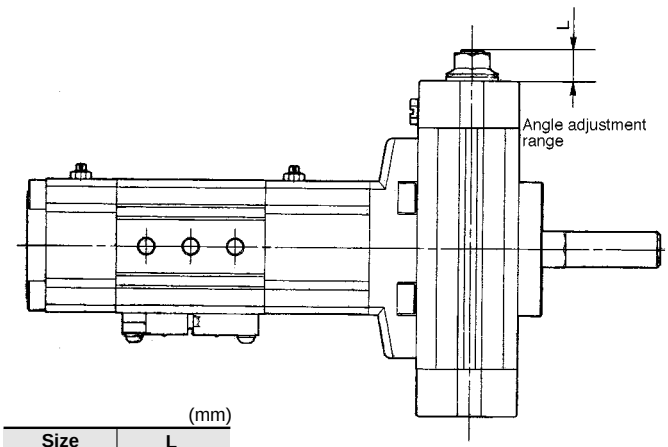
3 Non-standard angle adjustment range — Symbol -X5

MRQ | Mounting style | S^{32}_{40} | **Stroke** | Cushion | Rotation angle | X | Auto switch | **X5**

- X5: Non-standard angle adjustment range

The standard angle adjustment range of ±5°(one side) is changed to $^{+5°}_{-95°}$ in this type.



(mm)

Size	L
32	Max. 32
40	Max. 31.5

Possible to change the specification from standard to"-X5"

Specify the part number for hexagon socket head cap screw for angle adjustment referring to the list below.

Size	Part no.
32	P317010-13
40	

Attached parts:
- Hexagon socket head cap screw — 1 pc.
- Hexagon nut with flange — 1 pc.
- Seal washer — 1 pc.

∗One set of the actuator requires two sets of the hexagon socket head cap screws.

Series MRQ
