Cylinder with Lock: With Lock Status Indication

Ø32, Ø40, Ø50, Ø63, Ø80, Ø100

Safety Measure

Whether the cylinder is in a locked or manual lock released state can be visually confirmed at a glance.

The high visibility of the lock released state indication label allows for easy confirmation of the lock released state, even from a distance.

Available with a cap nut

Prevents the adhesion of spatter, foreign matter, etc.

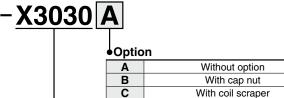

C96N Standard model no.

C96N Lock unit Standard model no.*1

*1 The lock unit is the same as that for the MWB-X3030 (G port).

The specifications and dimensions are the same as those of the standard C96N series model. Not applicable to the CP96N

C96N-X3030□

With coil scraper + cap nut
The model with a coil scraper is the same as the MWB-XC35.

♦ With lock status indication

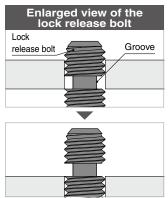

ø**32**

Changing from the manual lock released state to the locked state

Turn the lock release bolt counterclockwise.

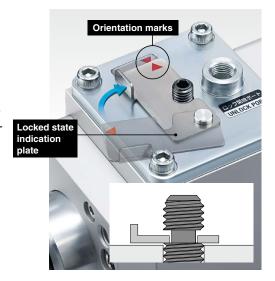

1. Continue to turn the bolt counterclockwise until the groove in the middle of the lock release bolt is completely above the body surface.

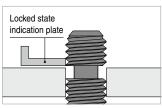

2 Align the groove and the locked state indication plate.

1. Insert the locked state indication plate into the groove in the bolt and align the orientation marks until the lock released state indication label (yellow) is no longer visible.

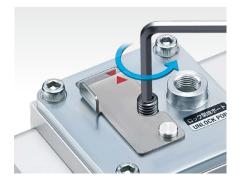

If the bolt is not sufficiently turned counterclockwise, the groove position will not be aligned and the locked state indication plate cannot be inserted.

3 Secure the locked state indication plate.

- 1. Continue to turn the lock release bolt counterclockwise.
- 2. The locked state indication plate will move upward, securing it.
- 3. Confirm that the locked state indication plate does not move.

When the locked state indication plate is secured, the end of the plate will be lifted slightly.

∆ Caution

■ Before operating the cylinder, be sure to first carry out a test operation to check for operation abnormalities as stated in the precautions in the C(P)96N Series Operation Manual on the SMC website.
