

## Scale Cylinder \& Counter Seresce

## CEP1/CEU5

Resolution: 0.01 mm (accuracy $\pm 0.02 \mathrm{~mm}$ )
External output function: RS-232C BCD
Multipoint output: 5 points ( 20 points with bank switching)

High Precision Scale Cylinder/ Series CEP1
Multi Counter/Series CEU5
Upgraded Scale Cylinder/Series CE1

## A chieve rationalizati

## A scale cylinder wit

## Measurement is possible throughout the full stroke range.

## The home position can be anywhere within the cylinder stroke. <br> When the counter is reset by pressing the cylinder rod to the reference plane, that point becomes the home position. <br> NeN High Precision Scale Cylinder (CEP1)

- Resolution: 0.01 mm (accuracy $\pm 0.02 \mathrm{~mm}$ )
- Special scraper now standard (IP-67)
- 2 kinds of seal material available (order made)
- Power supply voltage 12 to 24VDC

- Auto switch mounting orientation can be freely selected (3 mounting surfaces)

- Resolution: 0.1 mm (accuracy $\pm$ 0.2 mm )
- Water resistance improved by

- Power supply voltage 12 to 24VDC
- Abundant stroke variations
- Improved noise resistance

## System Configuration

## on of production lines i position feedback

## Tolerances of preset values can be set. (CEU1, CEU5)

Tolerances can be set for preset values.
CEU1: $\pm$ set tolerance
CEU5: + set tolerance, - set tolerance (separate settings)

## Simple operation

## Multi Counter (CEU5)

- Output terminal: 5 points
- Number of output settings: 20 points (bank switching) 31 points (binary output)
- Communication function with RS-232C
- With BCD output (optional)
- Maximum counting speed 100 kHz
- Prescale function
- With multiplication switching (1, 2, 4 multiplication)
- DIN rail mountable
- 6 digit counter display

Includes all functions of the CEU1
3 Point Preset Counter (CEU1)

## Applications

## Length/breadth discrimination

Straightening of work piece positions is performed at the same time that longitudinal or transverse orientation is distinguished.

## Inspection of machined holes

Can detect machined hole depth,
burrs and foreign matter, etc.

## Measurement of dimensions

Can measure dimensions of parts

## Confirmation of press-in

Can confirm the press-in of a hydraulic cylinder by detecting its stroke
Even if the size of the work piece changes, the point of press-in
completion can be easily changed.

## Discrimination of direction

Direction can be discriminated by measuring work piece height.

## Detection of lifter position

Can continuously monitor a
lifter's stroke.

Nozzle height adjustment
 machining dimensions
Performs adjustment of machining depth, etc. by measuring the part dimensions before machining.

## Measurement Principles

The amount of rod movement in the scale cylinder is detected using an MR element (magnetic resistance element) whose resistance value changes due to magnetic force. The detection unit containing this MR element is called the sensor head. An amplifying circuit and a dividing circuit are required to produce output which can be read by the counter, and these are attached to the cylinder case. The sensor head and amplifier section together are referred to as the sensor unit.

The scale cylinder is equipped with the capability of outputing the piston stroke movement as a pulse signal. The measurement principle is as shown in the drawing below.

(1) A scale of magnetic layers and non-magnetic layers with a pitch of 0.8 mm is cut into the piston rod.
(2) With movement of the piston rod, a sin, cos 2-phase signal (Signal 1) is received by the magnetic resistance element. For this wave form, 1 pitch ( 0.8 mm ) becomes exactly 1 cycle.
(3) This is amplified and divided into $1 / 8$ parts. As a result, a $90^{\circ}$ phase difference pulse signal of $0.1 \mathrm{~mm} /$ pulse (Signal 2 ) is output.
(4) By measuring this pulse signal with the counter, it is possible to detect the piston position with a resolution of 0.1 mm .
(5) In the case of the high precision scale cylinder, the sin, cos 2phase signal obtained in (2) is amplified and divided into $1 / 20$ parts. As a result, a $90^{\circ}$ phase difference pulse signal of $0.04 \mathrm{~mm} /$ pulse (Signal 2 ) is output.
(6) By multiplying this pulse signal by 4 with the counter, it is possible to detect the piston position with a resolution of 0.01 mm .

## A/B phase difference output

## ( $90^{\circ}$ phase difference output)

When movement is expressed by a single line of pulses, it is impossible to accurately identify the current position, because pulse waves appear in both upward and downward directions. Accordingly, in A/B phase difference output, two lines of pulses are provided, wherein one line detects the movement and the other distinguishes the direction.

## 4 times multiplication function

This function increases resolution 4 times by counting 4 for each cycle of pulses, instead of counting 1 for each cycle as is normally the case. In principle, this function counts each time there is a rise or fall in either of the $A$ or $B$ phase pulses.

## Counting speed (kHz, kcps)

Counting speed indicates the number of pulses that can be counted per second. If the scale cylinder is operated at high speeds, pulse waves are output in shorter cycles. The counting speed of the counter must be higher than the pulse speed for the maximum piston speed when operating. Since the scale cylinder outputs one pulse for each 0.1 mm of movement, 5,000 pulses will be output for each 500 mm of movement. Therefore, a speed of $500 \mathrm{~mm} / \mathrm{s}$ is equivalent to $5 \mathrm{kcps}(\mathrm{kHz})$, but a counting speed 2 to 3 times greater is recommended for actual operation.

## Accuracy

The accuracy is the difference between the dimensions based upon the signals of the scale cylinder and the absolute dimensions.
The maximum display error that will appear on the counter's digital display is equal to twice ( $\pm 1$ count) the resolution when the home position is reset and when dimensions are measured.

## Electrical Wiring

## Output type

The output signal of the high precision scale cylinder is $A / B$ phase difference output (open collector output) as shown in the figure below.
The relation between the movement distance and the signal output of the high precision scale cylinder is that for each 0.04 mm of movement a one pulse signal is output to both output terminals A and B . In order to measure with a discrimination of 0.01 mm , a counter with a 4 times multiplication function (CEU5) is required.

## Input/Output

The input/output of the scale cylinder is performed by a $\varnothing 7$ shielded twisted pair wire from the sensor section plus a connector.

Output circuit of scale cylinder (brown, blue)

Sensor Specifications

| Cable | $\varnothing 7,6$-core twisted pair shielded wire (oil, heat \& flame resistant cable) (Standard with connector ... made by TAJIMI ELECTRONICS CO., LTD., R04-J8M7.3) |
| :---: | :---: |
| Transmission distance | 23 m (when using SMC cable and counter) |
| Position detection system | Magnetic scale rod Sensor head <cable length 50 cm , 3m> <non-rotating> <incremental type> |
| Magnetic resistance | 145 gauss |
| Power supply | 12 to 24VDC ( $\pm 10 \%$ ) (power supply ripple: $1 \%$ or less) |
| Current consumption | 40 mA |
| Resolution | $0.1 \mathrm{~mm} / \mathrm{pulse}$ |
| Accuracy | $\pm 0.2 \mathrm{~mm}^{\text {Note 1) }}$ |
| Output type | Open collector (24VDC, 40mA) |
| Output signal | A/B phase difference output |
| Insulation resistance | $500 \mathrm{VDC}, 50 \mathrm{M} \Omega$ or more (between case and 12E) |
| Vibration resistance | 33.3Hz, 6.8G 2 hrs. each in $X, Y$ directions 4 hrs. in $Z$ direction based upon JIS D1601 |
| Impact resistance | 30G 3 times each in X, Y, Z directions |
| Enclosure | IP65 (IEC Standard) ${ }^{\text {Note 2) }}$ |
| Extension cable (optional) | $5 \mathrm{~m}, 10 \mathrm{~m}, 15 \mathrm{~m}, 20 \mathrm{~m}$ (Connector ... made by TAJIMI ELECTRONICS CO., LTD., R04-P8F7.3) |

Note1 ) This includes the digital display error of the counter (CEU1)
Note 2) The cylinder section does not have a water resistant enclosure.

## Electrical Wiring

## Output type

The output signal of the scale cylinder is A/B phase difference output (open collector output) as shown in the figure below.
The relation between the movement distance and the signal output of the scale cylinder is that for each 0.1 mm of movement a one pulse signal is output to both output terminals A and B.
Furthermore, the maximum response speed of the sensor for the scale cylinder is at a maximum cylinder speed of $1500 \mathrm{~mm} / \mathrm{s}(15 \mathrm{kcps})$.

## Input/Output

The input/output of the scale cylinder is performed by a $\varnothing 7$ shielded twisted pair wire from the sensor section plus a connector.

Rear view
Output circuit of scale cylinder (Brown, Blue)

## Signal table

| Wire color | Signal name | Connector pin <br> symbol |
| :---: | :---: | :---: |
| White | A phase | A |

## CEU5 Operation

## Display detail

Keys and functions

| Key | Function |
| :--- | :--- |
| MODE | Changes the mode. In any given condition, it shifts to the next mode. <br> Does not write data. |
| SEL. | Shifts the cursor to the next item. Does not write data. |
| SET | Writes displayed data into the memory when setting. |
| RIGHT | Shifts the cursor to the right when setting numerical values. |
| LEFT | Shifts the cursor to the left when setting numerical values. |
| UP | Changes the contents of a setting. Increases the value when setting numerical values. |
| DOWN | Changes the contents of a setting. Decreases the value when setting numerical values. |

In the explanations of the operating method, references to "direction keys" indicate the 4 keys RIGHT, LEFT, UP and DOWN.

## Counter Series CEU

Mode cycle using mode key

## Basic Operation

- SET key: In any of the conditions (1) through (5), this writes the display
data into the memory and shifts to (1).
- SEL. key : Shifts to the next item, but does not write data.
- MODE key: In any given condition, this shifts to the next mode, but
does not write data.

1. Explanation of display in count mode

Normal output display
Displays current output bank

Displays output state of each OUT terminal
Binary output display
Displays only when matched with preset

Display of binary output selection

## 2. Setting of preset mode

Selection of preset No.

- Select a preset number from 1 to 31 with the UP/DOWN keys.
- Shift to the next item with the SEL. key.

## Setting the preset value

- Shift the digits with the LEFT/RIGHT keys, and increase or decrease numerical values with the UP/DOWN keys. - Shift to the next item with the SEL. key.

## Setting the upper limit tolerance

- Set numerical values in the same way with the direction keys.
- When $\pm$ is selected, the lower limit display is cleared and $\pm$ setting is possible.
- Shift to the next item with the SEL. key.

Setting the lower limit tolerance

- Set numerical values in the same way with the direction keys.
- When $\pm$ is selected in the upper limit setting, this item is not displayed.
- Shift to the next item with the SEL. key.

Setting the output configuration

- Switch to 1SHOT, HOLD or COMPARE with the UP/DOWN keys.
- Store the setting with the SET key.
- The SEL. key only shifts to another item without storing the setting.

## Series CEU

## CEU5 Operation

## (3) Explanation of settings in the function mode

If the UP/DOWN keys are pressed when an item name is flashing, it shifts to another setting item. When the SEL. key is pressed, the cursor shifts and it is possible to change the content of the setting for the item which is being displayed.
(3)-1

- When the SEL. key is pressed while STOP is flashing, the setting mode is selected for the stop output waiting time.

- The output system setting mode is selected by pressing the SEL. key while OUTPUT is flashing.

- The input system setting mode is selected by pressing the SEL. key while INPUT is flashing.

- The count value backup setting mode is selected by pressing the SEL. key while BACKUP is flashing.

- The RS-232C communication speed setting mode is selected by pressing the SEL. key while RS232 is flashing.

- The unit number registration mode is selected by pressing the SEL. key while UNIT is flashing.

- Set numerical values with the direction keys.
- The unit is 0.1 sec .
- Store the setting with the SET key.
- The SEL. key only shifts the cursor without storing the setting.

- Select normal output or binary output with the UP/DOWN keys.
- Store the setting with the SET key.
- The SEL. key only shifts the cursor without storing the setting.

- Select ON or OFF with the

UP/DOWN keys.

- Store the setting with the SET key.
- The SEL. key only shifts the cursor without storing the setting.

- Select the communication speed from 1200, 2400, 4800,9600 or 19200 with the UP/DOWN keys.
- Store the setting with the SET key.
- The SEL. key only shifts the cursor without storing the setting.

[^4]
## Series CEU

## CEU1 Operation

Keys and functions

| Key | Function |
| :--- | :--- |
| MODE | Switches between the count mode and the setting mode. |
| SHIFT | Switches digits for preset data input and allowable value input. <br> Shifts the flashing cursor to the left each time it is pressed. |
| SEL | In the setting mode, this switches the output terminal number which is to be set. <br> Switches in the order OUT1 $\rightarrow$ OUT2 $\rightarrow$ OUT3 each time it is pressed. |
| DATA | In the setting mode, this changes numerical values, or codes and symbols. <br> Numerical values increase by 1 each time it is pressed. For positive and negative codes, a <br> minus sign turns on or off. |
| SET | Registers the setting contents in the setting mode. <br> Press this key to perform registration after making setting changes. The setting will not <br> be registered if the screen is changed by pressing the [MODE] or [SEL] keys without <br> pressing the [SET] key. |

The counter mode changes in the order shown below each time the [MODE] key is pressed.

- Output terminals 1 through 3 can be set separately.
- In the model CEU1, the allowable value is a $\pm$ value. (Only the model CEU5 is equipped with a function to set different values for the upper and lower limits.)

## Series CE <br> Glossary (CEU5 Functions)

## BCD Output

This is a system which expresses one digit of a decimal number with a 4 digit binary number.
The count value is expressed by the ON/OFF state of each BCD output terminal. In the case of 6 digits, 24 terminals are required.

The relation between decimal numbers and BCD codes is shown in the table below.

| Decimal No. | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| BCD | 0000 | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 0111 | 1000 | 1001 |

Ex.) 1294.53 is expressed as follows.
000100101001010001010011

## RS-232C

This is the interface standard for the serial transmission method, which is standard equipment on a personal computer.

## Prescale Function

This function allows free setting of how many millimeters will indicate one pulse.

## Binary Output

31 point preset output is possible without bank switching, by means of binary system output from a 5 point output terminal. Cylinder stop output is used as the readout release signal.

When the count value coincides with preset No. 3

Output terminal Pattern indicating No. 3

| $(1)$ | $(2)$ | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: |
| On | On | Off | Off | Off |

The coincident preset number is expressed as a 5 digit binary number.

## Bank Function

5 points of preset output are possible simultaneously, however, a maximum of 20 types of work discrimination, etc. can be performed by using the 5 points of preset values as one of a maximum of four quadrats, and switching its use during operation.

For example, when bank 2 is selected, presets 6 through 10 are valid and when the count value coincides with the setting value of 6 through 10, the respective output terminals (1) through (5) are turned ON .

Bank switching correspondence table

| Bank No. | BANK 2 | BANK 1 |
| :---: | :---: | :---: |
| 1 | OFF | OFF |
| 2 | OFF | ON |
| 3 | ON | OFF |
| 4 | ON | ON |

## Glossary (CEU5 Functions)

## Display Offset Function

Normally the count value returns to " 0 " after resetting, but with this function, the initial value can be set to any desired value.

## Hold Function

When "hold" is input, the counter holds the current count value in memory. Next, when the count value is read into a PLC which uses serial or BCD output, etc., the count value that was held can be read in, even if there is a time lag.

## Setting of Preset Value Tolerances

In the current model CEU1, the preset value tolerances could only be set as $\pm$, but now it has become possible to set an upper and lower limit of +Omm and $-\Delta \mathrm{mm}$.

By including preset tolerance setting, superior performance is exhibited in parts inspections, etc. In a work piece to be measured, there are tolerances which assure a good product. For example, in the case of $10_{-0.02}^{+0.05}$, the CEU5 allows these tolerances to be input as they stand. If the work piece is within tolerances the OK signal is sent.
On the other hand, in ordinary counters, No. 1 is set to 9.98 and No. 2 is set to 10.06, and if No. 1 is ON and No. 2 is OFF, an acceptance decision is made. 2 points of output are used in order to check whether or not the product is within dimension tolerances. In this example, one preset of the CEU5 performs the same function as two presets of an ordinary counter.
<Simple input as per drawing dimensions> Tolerances can be set with the preset value.

OK/NG signal is output by the counter. Labor savings can be realized in parts inspections.

## Count Value Protection

In the past, the count value returned to " 0 " when the power supply was cut off, but this function holds the previous value even after a power failure. This function can be switched between active and inactive settings.

## Cylinder Stop Output

When work piece discrimination is performed using a preset counter, it has been common to estimate the amount of time from the cylinder's start of operation until it touches the work piece and stops, using a timer to read the output after a fixed amount of time.
Since cylinder stop output is now output when there is no cylinder movement for a fixed amount of time, timing of preset output and external output, etc. is simplified.

## $\triangle$ Specific Product Precautions

## Auto Switch Common Specifications

| Type | Reed switch | Solid state switch |
| :---: | :---: | :---: |
| Leakage current | None | 3 wire： $10 \mu \mathrm{~A}$ or less 2 wire： 1 mA or less |
| Operating time | 1.2 ms | $1 \mathrm{~ms} \mathrm{or} \mathrm{less} \mathrm{Note} \mathrm{3)}$ |
| Impact resistance | $300 \mathrm{~m} / \mathrm{s}^{2}$ \｛30．6G\} | $1000 \mathrm{~m} / \mathrm{s}^{2}$ \｛102G\} |
| Insulation resistance | $50 \mathrm{M} \Omega$ or more with a 500VDC megohmmeter（between lead wire \＆case） |  |
| Withstand voltage | 1500VAC for 1 min．Note 1） （between lead wire \＆case） | 1000VAC for 1 min． （between lead wire \＆case） |
| Ambient temperature | -10 to $60^{\circ} \mathrm{C}$ |  |
| Enclosure | IEC529 standard IP67， JISC0920 watertight construction Note 2） |  |

Note 1）Electrical entry：Connector type（A73C，A80C，C73C，C80C）and D－9，9 $\square$ A ，A9，A9 $\square \mathrm{V}$ are 1000 VAC for 1 min ．（between lead wire and case）
Note 2）Terminal conduit type（D－A3，A3 $\square$ A，A3 $\square$ C，G39，G39A，G39C，K39A，K39C）and DIN terminal type（D－A44，A44A，A44C）are IEC529 standard IP63，JISC0920 raintight construction．
Note 3）Excluding solid state switches with timer（D－M5 $\square$ TL，G5NTL，F7NTL，F5NTL）and ferromagnetic resistant 2 color indicator type solid state switch（D－P5DWL）．D－J51 is 5 ms or less．

## Lead Wire Length

## Lead wire length designation（example）

| $\mathbf{N i l}$ | 0.5 m |
| :--- | :--- |
| $\mathbf{L}$ | 3 m |
| $\mathbf{Z}$ | 5 m |
| $\mathbf{N}^{\text {Note })}$ | None |

Note 1）Lead wire length Z：Auto switches applicable for 5 m
Reed switch：D－B53／B54，D－C73（C）／C80C，D－A73（C）（H）／A80C
D-A53/A54, D-Z73, D-90/97/90A/93A

Solid state switch：All models are produced upon receipt of order（standard procedure）． However，this does not include D－F9，F9 $\square$ V and F7 $\square$ WV．
Note 2）A lead wire length of 3 m is standard for solid state switches with timer and water resistant 2 color indicator type solid state switches．（ 0.5 m is not available．）
Note 3）Lead wire lengths of 3 m and 5 m are standard for ferromagnetic resistant 2 color indicator type solid state switches．（ 0.5 m is not available．）

Part Nos．of lead wires with connectors
（applicable only for connector type）

| Type | Lead wire length |
| :---: | :---: |
| D－LC05 | 0.5 m |
| D－LC30 | 3 m |
| D－LC50 | 5 m |

## Series CE <br> Auto Switch

## Contact Protection Box

D-A7 and D-A8 type switches do not have built-in contact protection circuits. A contact protection box should be used in cases such as when there is an induction load, when lead wires are 5 m or longer, and with 100 V or 200VAC.

| Part No. | Operating voltage | Lead wire length |
| :---: | :---: | :---: |
| CD-P11 | 100V, 200VAC | Switch connection side: 0.5 m <br> Load connection side: 0.5 m |
| CD-P12 | 24 VDC |  |

* Since D-A8 switches have no particular voltage designation below 100VAC, type selection should be based upon the operating voltage.

Contact protection box internal circuits

Lead wire colors inside [ ] are those prior to conformity with IEC standards.

## Switch Hysteresis

Note) This varies according to the operating environment, and cannot be guaranteed.
Contact SMC in case of an operational problem due to hysteresis.

# Series CE <br> Auto Switch <br> Connections and Examples 

## Basic Wiring

 are the same.)

(Power supply for switch and load are separate.)

Solid state 3 wire, PNP

[Black]

## Examples of Connection to PLC (Sequence Controller)

Specification for sink input

2 wire

## Specification for source input

2 wire

Connect according to the applicable PLC input specifications, as the connection method will vary depending on the PLC input specifications.

## Connection Examples for AND (Series) and OR (Parallel)

2 wire with 2 switch AND connection

When two switches are connected in series, a load may malfunction because the load voltage will decline when in the ON state.
The indicator lights will light up if both of the switches are in the ON state.
Load voltage at ON = $\begin{gathered}\text { Power supply } \\ \text { voltage }\end{gathered}$ Residual $\begin{gathered}\text { Roltage } \\ \text { ves. }\end{gathered}$

$$
\begin{aligned}
& =24 \mathrm{~V}-4 \mathrm{~V} \times 2 \mathrm{pcs} . \\
& =16 \mathrm{~V}
\end{aligned}
$$

Example: Power supply is 24VDC Voltage decline in switch is 4 V

AND connection for NPN output (Performed with switches only)

The indicator lights will light up when both switches are turned ON.

## 2 wire with 2 switch OR connection

<Solid state> When two switches are connected in $\oplus$ parallel, malfunction may occur because the load voltage will increase when in the OFF state.

Load voltage at $O F F=\underset{\text { current }}{\text { leakage }} \times 2$ pcs. x impedad

$$
=1 \mathrm{~mA} \times 2 \mathrm{pcs} \times 3 \mathrm{k} \Omega
$$

OR connection for NPN output

<Reed switch> Because there is no current leakage, the load voltage will not increase when turned OFF, but due to the number of switches in the ON state, the indicator lights will sometimes get dark or not light up, because of dispersion and reduction of the current flowing to the switches.

$$
=6 \mathrm{~V}
$$

Example: Load impedance is $3 \mathrm{k} \Omega$
Leakage current from switch is 1 mA

## Series CE <br> Related Products

## Scale Cylinder with Brake/CE2 Controller/CEU2

A cylinder capable of highly reproducible positioning (stopping accuracy of $\pm 0.5 \mathrm{~mm}$ ) has been created by adding a brake mechanism to a scale cylinder which can measure stroke length.

## Series CE <br> Related Products

## Rodless Scale Cylinder with Brake/ML2B

A cylinder capable of highly reproducible positioning (stopping accuracy of $\pm 0.5 \mathrm{~mm}$ ) has been achieved by adding a brake mechanism and stroke sensor to a mechanically jointed rodless cylinder.

## Brake mechanism

Employs a combination spring and air pressure locking system When there is a drop in air pressure or air compression is stopped, the slider is held by a spring lock.

The brake mechanism keeps a load from being applied to the cylinder section
The slider can be stopped without harming cylinder
performance, because a load is not applied to the cylinder section. This is achieved by a structure in which the spring force acts directly on the brake shoe, pressing the brake plate on the right and left.

## Measurement function

Resolution: 0.1 (accurancy $\pm 0.2 \mathrm{~mm}$ )
Measurement is performed by a scale
plate and a built-in detection head.

## Can lock in both directions

Locking is possible on either of the cylinder's reciprocating strokes.

## Rodless cylinder

Highly flexible port variations Concentrated port type (air drive)

## Maintenance

The brake mechanism can be disassembled and replaced as a unit. In addition, manual release is possible.

Stroke adjustment unit combines a shock absorber and stopper bolt The stroke is adjustable. The shock absorber is a non-adjustable energy absorbing part.

Excellent mountability \& space savings

## Series CE

## Safety Instructions

These safety instructions are intended to prevent a hazardous situation and/or equipment damage. These instructions indicate the level of potential hazard by a label of "Caution", "Warning" or "Danger". To ensure safety, be sure to observe ISO 4414 Note 1), JIS B 8370 Note 2) and other safety practices.

```
|
I Caution: Operator error could result in injury or equipment damage
A Warning: Operator error could result in serious injury or loss of life.
I
I Danger : In extreme conditions, there is a possible result of serious injury or loss of life.
|
Note 1) ISO 4414: Pneumatic fluid power - Recommendations for the application of equipment to transmission and control systems.
```

Note 2) JIS B 8370: Pneumatic system axiom.

## Warning

1 The compatibility of pneumatic equipment is the responsibility of the person who designs the pneumatic system or decides its specifications.
Since the products specified here are used in various operating conditions, their compatibility for the specific pneumatic system must be based on specifications or after analysis and/or tests to meet your specific requirements.
2 Only trained personnel should operate pneumatically operated machinery and equipment.
Compressed air can be dangerous if an operator is unfamiliar with it. Assembly, handling or repair of pneumatic systems should be performed by trained and experienced operators.
3 Do not service machinery/equipment or attempt to remove components until safety is confirmed.
1.Inspection and maintenance of machinery/equipment should only be performed after confirmation of safe locked-out control positions.
2.When equipment is to be removed, confirm the safety process as mentioned above. Cut the supply pressure for this equipment and exhaust all residual compressed air in the system.
3.Before machinery/equipment is restarted, take measures to prevent shooting-out of cylinder piston rod, etc. (Bleed air into the system gradually to create back-pressure.)
4 Contact SMC if the product is to be used in any of the following conditions:
1.Conditions and environments beyond the given specifications, or if product is used outdoors.
2.Installation on equipment in conjunction with atomic energy, railway, air navigation, vehicles, medical equipment, food and beverages, recreation equipment, emergency stop circuits, press applications, or safety equipment.
3.An application which has the possibility of having negative effects on people, property, or animals, requiring special safety analysis.

Series CE
Actuator Precautions 1
Be sure to read before handling.

## Precautions on design

## Warning

1. There is a possibility of dangerous sudden action by air cylinders if sliding parts of machinery are twisted due to external forces, etc.
In such cases, human injury may occur; e.g., by catching hands or feet in the machinery, or damage to the machinery itself may occur. Therefore, the machine should be designed to avoid such dangers.
2. A protective cover is recommended to minimize the risk of personal injury.
If a stationary object and moving parts of a cylinder are in close proximity, personal injury may occur. Design the structure to avoid contact with the human body
3. Securely tighten all stationary parts and connected parts so that they will not become loose.
When a cylinder operates with high frequency or a cylinder is installed where there is a lot of vibration, ensure that all parts remain secure.
4. A deceleration circuit or shock absorber, etc., may be required.
When a driven object is operated at high speed or the load is heavy, a cylinder's cushion will not be sufficient to absorb the impact. Install a deceleration circuit to reduce the speed before cushioning, or install an external shock absorber to relieve the impact. In this case, the rigidity of the machinery should also be examined.
5. Consider a possible drop in operating pressure due to a power outage, etc.
When a cylinder is used in a clamping mechanism, there is a danger of work dropping if there is a decrease in clamping force due to a drop in circuit pressure caused by a power outage, etc. Therefore, safety equipment should be installed to prevent damage to machinery and human injury. Suspension mechanisms and lifting devices also require consideration for drop prevention.
6. Consider a possible loss of power source.

Measures should be taken to protect against human injury and equipment damage in the event that there is a loss of power to equipment controlled by air pressure, electricity or hydraulics, etc.
7. Design circuitry to prevent sudden lurching of driven objects.
When a cylinder is driven by an exhaust center type directional control valve or when starting up after residual pressure is exhausted from the circuit, etc., the piston and its driven object will lurch at high speed if pressure is applied to one side of the cylinder because of the absence of air pressure inside the cylinder. Therefore, equipment should be selected and circuits designed to prevent sudden lurching, because there is a danger of human injury and/or damage to equipment when this occurs.
8. Consider emergency stops.

Design so that human injury and/or damage to machinery and equipment will not be caused when machinery is stopped by a safety device under abnormal conditions, a power outage or a manual emergency stop.
9. Consider the action when operation is restarted after an emergency stop or abnormal stop.
Design the machinery so that human injury or equipment damage will not occur upon restart of operation. When the cylinder has to be reset at the starting position, install manual safety equipment.

Selection

## § Warning

## 1. Check the specifications

The products advertised in this catalog are designed according to use in industrial compressed air systems. If the products are used in conditions where pressure, temperature, etc., are out of specification, damage and/or malfunction may be caused. Do not use in these conditions.
Consult SMC if you use a fluid other than compressed air.

## 2. Intermediate stops.

When intermediate stopping of a cylinder piston is performed with a 3 position closed center type directional control valve, it is difficult to achieve stopping positions as accurate and minute as with hydraulic pressure, due to the compressibility of air.
Furthermore, since valves and cylinders, etc. are not guaranteed for zero air leakage, it may not be possible to hold a stopped position for an extended period of time. Contact SMC in case it is necessary to hold a stopped position for an extended period.

## Caution

1. Use a speed controller to adjust the cylinder drive speed, gradually increasing from a low speed to the desired speed setting.

## Mounting

## $\triangle$ Caution

1. Do not apply strong impact or large moment, etc. when mounting a work piece.
An external force greater than the allowable moment can cause rattling in the guide unit and increased sliding resistance, etc.
2. Do not use in applications subject to the effect of a large external force or impact force, etc.
This can cause failure.
3. Do not use until you verify that the equipment can operate properly.
After mounting, repair or modification, etc., connect the air supply and electric power, and then confirm proper mounting by means of appropriate function and leak inspections.

## 4. Instruction manual.

The product should be mounted and operated after thoroughly reading the manual and understanding its contents.
Keep the instruction manual where it can be referred to as needed.

## Piping

## $\triangle$ Caution

## 1. Preparation before piping.

Before piping is connected, it should be thoroughly blown out with air (flushing) or washed to remove cutting chips, cutting oil and other debris from inside the pipe.

Series CE Actuator Precautions 2
Be sure to read before handling.

## Lubrication

## Caution

## 1. Lubrication of non-lube type cylinder.

The cylinder is lubricated at the factory and can be used without any further lubrication.
However, in the event that it will be lubricated, use turbine oil class 1 (with no additives) ISO VG32.
Stopping lubrication later may lead to malfunction due to the loss of the original lubricant. Therefore, lubrication must be continued once it has been started.

## Air Supply

## Warning

1. Use clean air.

If compressed air includes chemicals, synthetic oils containing organic solvents, salt or corrosive gases, etc., it can cause damage or malfunction.

## $\triangle$ Caution

1. Install air filters.

Install air filters at the upstream side of valves. The filtration degree should be $5 \mu \mathrm{~m}$ or less.
2. Install an air dryer, after cooler, etc.

Air that includes much condensate causes malfunction of valves and other pneumatic equipment. To prevent this, install an air dryer, after cooler, etc.
3. Use the product within the specified range of fluid and ambient temperature.
Take measures to prevent freezing, since moisture in circuits will be frozen under $-5^{\circ} \mathrm{C}$, and this may cause damage to seals and lead to malfunction.
Refer to the "Air Cleaning Equipment" catalog for details on compressed air quality.

## Operating Environment

## . Warning

1. Do not use in environments where there is a danger of corrosion.
Refer to the construction drawings regarding cylinder materials.
2. In dirty areas, such as dusty locations or where water, oil, etc. splash on the equipment, take suitable measures to protect the entire actuator.
3. When using auto switches, do not operate in an environment with strong magnetic fields.

## Caution

1. Do not use in an environment where fluids such as cutting oil will come into direct contact with the actuator.
Operation in environments where fluids such as cutting oil, coolant or oil mist come into contact with the actuator body can cause rattling, increased sliding resistance and air leaks, etc.

## Operating Environment

## Caution

2. Do not operate in an environment where particulate matter, dust, cutting chips or spatter, etc. come into direct contact with the actuator.
This can cause rattling, increased sliding resistance and air leaks, etc.
Contact SMC regarding applications in this kind of environment.
3. Provide shading in locations which receive direct sunlight.
4. Block off any nearby heat sources.

When heat sources are present in the vicinity, it is possible for radiated heat to raise the product's temperature beyond its operating temperature range. In this case, a cover, etc. should be provided. to block the heat.
5. Do not operate in locations where vibration or impact occur.
Since this can cause damage or malfunction, etc., contact SMC regarding applications in this kind of environment.
6. Do not allow items influenced by magnetism near the actuator.
Since magnets are built into the cylinder, items such as magnetic disks, magnetic cards or magnetic tapes should not be allowed nearby, as data may be destroyed.

Maintenance

## $\triangle$ Warning

1. Maintenance should be done according to the procedure indicated in the operating manual.
If handled improperly, malfunction and damage of machinery or equipment may occur.
2. Machine maintenance, and supply and exhaust of compressed air.
When machinery is serviced, first check measures to prevent dropping of driven objects and run-away of equipment, etc. Then cut off the supply pressure and electric power, and exhaust all compressed air from the system.
When machinery is restarted, check that operation is normal with actuators in the proper positions.

## Caution

## 1. Drain flushing.

Remove condensate from air filters regularly.
(Refer to specifications.)

Series CE
Auto Switch Precautions 1
Be sure to read before handling.

## Design \& Selection

## $\triangle$ Warning

## 1. Confirm the specifications.

Read the specifications carefully and use this product appropriately. The product may be damaged or malfunction if it is used outside the range of specifications for current load, voltage, temperature or impact.
2. Take precautions when multiple cylinders are used close together.
When multiple auto switch cylinders are used in close proximity, magnetic field interference may cause the switches to malfunction. Maintain a minimum cylinder separation of 40 mm .
3. Pay attention to the length of time that a switch is ON at an intermediate stroke position.
When an auto switch is placed at an intermediate position of the stroke and a load is driven at the time the piston passes, the auto switch will operate, but if the speed is too great the operating time will be shortened and the load may not operate properly. The maximum detectable piston speed is:

$$
\mathrm{V}(\mathrm{~mm} / \mathrm{s})=\frac{\text { Auto switch operating range }(\mathrm{mm})}{\text { Time load applied }(\mathrm{ms})} \times 1000
$$

4. Wiring should be kept as short as possible. <Reed switch>
As the length of the wiring to a load gets longer, the rush current at switching ON becomes greater, and this may shorten the product's life. (The switch will stay ON all the time.)
1) For an auto switch without a contact protection circuit, use a contact protection box when the wire length is 5 m or longer.
2) Even if an auto switch has a built-in contact protection circuit, when the wiring is more than 30 m long, it is not able to adequately absorb the rush current and its life may be reduced. It is again necessary to connect a contact protection box in order to extend its life. Please contact SMC in this case.

## <Solid state switch>

3) Although wire length should not affect switch function, use a wire 100 m or shorter.
5. Take precautions for the internal voltage drop of the switch.

## <Reed switch>

1) Switches with an indicator light (Except D-A76H, A96, A96V)

- If auto switches are connected in series as shown below, take note that there will be a large voltage drop because of internal resistance in the light emitting diode. (Refer to internal voltage drop in the auto switch specifications.)
[The voltage drop will be " $n$ " times larger when " $n$ " auto switches are connected.]
Even though an auto switch operates normally, the load may not operate.

## $\triangle$ Warning

- In the same way, when operating under a specified voltage, although an auto switch may operate normally, the load may not operate. Therefore, the formula below should be satisfied after confirming the minimum operating voltage of the load.

2) If the internal resistance of a light emitting diode causes a problem, select a switch without an indicator lamp (Model D-A80, A80H, A90, A90V).
<Solid state switch>
3) Generally, the internal voltage drop will be greater with a 2 wire solid state auto switch than with a reed switch. Take the same precautions as in 1).
Also, note that a 12VDC relay is not applicable.
6. Pay attention to leakage current.
<Solid state switch>
With a 2 wire solid state auto switch, current (leakage current) flows to the load to operate the internal circuit even when in the OFF state.

Operating current of load (OFF condition) > Leakage current
If the criteria given in the above formula are not met, it will not reset correctly (stays ON). Use a 3 wire switch if this specification will not be satisfied.
Moreover, leakage current flow to the load will be "n" times larger when " n " auto switches are connected in parallel.
7. Do not use a load that generates surge voltage.
<Reed switch>
If driving a load such as a relay that generates a surge voltage, use a switch with a built-in contact protection circuit or use a contact protection box.
<Solid state switch>
Although a zener diode for surge protection is connected at the output side of a solid state auto switch, damage may still occur if the surge is applied repeatedly. When a load, such as a relay or solenoid, which generates surge is directly driven, use a type of switch with a built-in surge absorbing element.
8. Cautions for use in an interlock circuit.

When an auto switch is used for an interlock signal requiring high reliability, devise a double interlock system to avoid trouble by providing a mechanical protection function, or by also using another switch (sensor) together with the auto switch. Also perform periodic maintenance and confirm proper operation.
9. Ensure sufficient clearance for maintenance activities.
When designing an application, be sure to allow sufficient clearance for maintenance and inspections.

Series CE
Auto Switch Precautions 2
Be sure to read before handling.

## Mounting \& Adjustment

## © Warning

## 1. Do not drop or bump.

Do not drop, bump or apply excessive impacts ( $300 \mathrm{~m} / \mathrm{s}^{2}$ or more for reed switches and $1000 \mathrm{~m} / \mathrm{s}^{2}$ or more for solid state switches) while handling.
Although the body of the switch may not be damaged, the inside of the switch could be damaged and cause a malfunction.
2. Do not carry a cylinder by the auto switch lead wires.
Never carry a cylinder by its lead wires. This may not only cause broken lead wires, but it may cause internal elements of the switch to be damaged by the stress.

## 3. Mount switches using the proper fastening torque.

When a switch is tightened beyond the range of fastening torque, the mounting screws, mounting bracket or switch may be damaged. On the other hand, tightening below the range of fastening torque may allow the switch to slip out of position.
4. Mount a switch at the center of the operating range.
Adjust the mounting position of an auto switch so that the piston stops at the center of the operating range (the range in which a switch is ON).
(The mounting position shown in a catalog indicates the optimum position at stroke end.) If mounted at the end of the operating range (around the borderline of ON and OFF), operation will be unstable.

## Wiring

## Warning

1. Avoid repeatedly bending or stretching lead wires.
Broken lead wires will result from applying bending stress or stretching force to the lead wires.
2. Be sure to connect the load before power is applied.

## <2 wire type>

If the power is turned ON when an auto switch is not connected to a load, the switch will be instantly damaged because of excess current.
3. Confirm proper insulation of wiring.

Be certain that there is no faulty wiring insulation (contact with other circuits, ground fault, improper insulation between terminals, etc.). Damage may occur due to excess current flow into a switch.
4. Do not wire with power lines or high voltage lines.
Wire separately from power lines or high voltage lines, avoiding parallel wiring or wiring in the same conduit with these lines. Control circuits, including auto switches, may malfunction due to noise from these other lines.
5. Do not allow short circuit of loads.

## <Reed switch>

If the power is turned ON with a load in a short-circuited condition, the switch will be instantly damaged because of excess current flow into the switch.

## Wiring

## Warning

<Solid state switch>
Model D-F9 $\square(\mathrm{V})$, $\mathrm{F9} \square \mathrm{~W}(\mathrm{~V})$ and all models of PNP output type switches do not have built-in short circuit prevention circuits. If loads are short circuited, the switches will be instantly damaged Take special care to avoid reverse wiring with the brown (red) power supply line and the black (white) output line on 3 wire type switches.

## 6. Avoid incorrect wiring.

<Reed switch>
A 24VDC switch with indicator light has polarity. The brown lead wire or terminal No. 1 is (+), and the blue lead wire or terminal No. 2 is ( - ).

1) If connections are reversed, a switch will operate, however, the light emitting diode will not light up.
Also note that a current greater than that specified will damage a light emitting diode and it will no longer operate.
Applicable models: D-A73, A73H, D-A93, A93V
2) Note however, that in the case of 2 color indicator type auto switches (D-A79W), if the wiring is reversed, the the switch will be in a normally ON condition.
<Solid state switch>
3) If connections are reversed on a 2 wire type switch, the switch will not be damaged if protected by a protection circuit, but the switch will always stay in an ON state. However, it is still necessary to avoid reversed connections, since the switch could be damaged by a load short circuit in this condition.
4) If connections are reversed (power supply line + and power supply line -) on a 3 wire type switch, the switch will be protected by a protection circuit. However, if the power supply line (+) is con nected to the blue (black) wire and the power supply line (-) is connected to the black (white) wire, the switch will be damaged.

## Lead wire color changes

Lead wire colors of SMC switches and related products have been changed in order to meet NECA (Nippon Electric Control Equipment Industries Association) Standard 0402 for production beginning September, 1996 and thereafter. Please refer to the tables provided.
Special care should be taken regarding wire polarity during the time that the old colors still coexist with the new colors.

| 2 wire |  |  | 3 wire |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Old | New |  | Old | New |
| Output (+) | Red | Brown | Power supply | Red | Brown |
| Output (-) | Black | Blue | GND | Black | Blue |
|  |  |  | Output | White | Black |
| Solid state switch with diagnostic output |  |  | Solid state switch with latch type diagnostic output |  |  |
|  | Old | New |  | Old | New |
| Power supply | Red | Brown | Power supply | Red | Brown |
| GND | Black | Blue | GND | Black | Blue |
| Output | White | Black | Output | White | Black |
| Diagnostic Output | Yellow | Orange | Latch type diagnostic Output | Yellow | Orange |

Series CE
Auto Switch Precautions 3
Be sure to read before handling.

## $\triangle$ Warning

1. Never use in an atmosphere of explosive gases.
The structure of auto switches is not intended to prevent explosion. Never use in an atmosphere with an explosive gas since this may cause a serious explosion.
2. Do not use in an area where a magnetic field is generated.
Auto switches will malfunction or magnets inside cylinders will become demagnetized. (Consult SMC regarding the availability of a magnetic field resistant auto switch.)
3. Do not use in an environment where the auto switch will be continually exposed to water.
Although switches, except for a few models, satisfy IEC standard IP67 construction (JIS C 0920: watertight construction), do not use switches in applications where continually exposed to water splash or spray. Poor insulation or swelling of the potting resin inside switches may cause malfunction
4. Do not use in an environment with oil or chemicals.
Consult SMC if auto switches will be used in an environment with coolant, cleaning solvent, various oils or chemicals. If auto switches are used under these conditions for even a short time, they may be adversely affected by improper insulation, malfunction due to swelling of the potting resin, or hardening of the lead wires.
5. Do not use in an environment with temperature cycles.
Consult SMC if switches are used where there are temperature cycles other than normal temperature changes, as they may be adversely affected
6. Do not use in an environment where there is excessive impact.
<Reed switch>
When excessive impact ( $300 \mathrm{~m} / \mathrm{s} 2$ or more) is applied to a reed switch during operation, the contact point will malfunction and generate or cut off a signal momentarily ( 1 ms or less). Consult SMC regarding the need to use a solid state switch depending upon the environment.
7. Do not use in an area where surges are generated.
<Solid state switch>
When there are units (solenoid type lifter, high frequency induction furnace, motor, etc.) which generate a large amount of surge in the area around cylinders with solid state auto switches, this may cause deterioration or damage to the switch. Avoid sources of surge generation and disorganized lines.
8. Avoid accumulation of iron powder or close contact with magnetic substances.
When a large amount of ferrous powder such as machining chips or spatter is accumulated, or a magnetic substance (something attracted by a magnet) is brought into close proximity with an auto switch cylinder, it may cause the auto switch to malfunction due to a loss of the magnetic force inside the cylinder.

## Maintenance

## © Warning

1. Perform the following maintenance periodically in order to prevent possible danger due to unexpected auto switch malfunction.
1) Secure and tighten switch mounting screws.

If screws become loose or the mounting position is dislocated, retighten them after readjusting the mounting position.
2) Confirm that there is no damage to lead wires.

To prevent faulty insulation, replace switches or repair lead wires, etc., if damage is discovered.
3) Confirm the lighting of the green light on the 2 color indicator type switch.

Confirm that the green LED is on when stopped at the established position. If the red LED is on, the mounting position is not appropriate. Readjust the mounting position until the green LED lights up.

## Other

## Warning

1. Consult SMC concerning water resistance, elasticity of lead wires, and usage at welding sites, etc.

## Series CE / Specific Product Precautions

Be sure to read before handling. Refer to pages 36 through 41 for safety precautions, actuator precautions and auto switch precautions.

## Mounting

## Caution

1. When screwing a nut or fitting, etc. onto the threaded section at the end of the piston rod, return the piston rod to its fully retracted position, and grasp the exposed portion of the rod across two parallel sides with a wrench. In the case of the high precision scale cylinder, there are no parallel sides. Secure the work piece with a double nut.
Note) Do not apply rotational torque to the piston rod.

2. The load on the piston rod should normally be applied in an axial direction.

- In case a load is applied that is not in the axial direction of the cylinder, the load itself should be controlled with a guide.
- When mounting the cylinder, it should be carefully aligned.

3. Applications which apply rotational torque to the piston rod should be avoided.
4. Be careful to avoid scratches or dents, etc. on the sliding sections of the piston rod.

## Sensor Unit

## Caution

1. The sensor unit is adjusted to the proper position at the time of shipment. Therefore, the sensor unit should not be removed from the body under any circumstances.
2. The cylinder should be protected from contact with liquids such as coolants or coolant water. (CE1)
3. The sensor cable should not be pulled with a strong force.
4. Since the scale cylinder sensor uses a magnetic system, malfunction may occur if there is a strong magnetic field near the sensor.
The cylinder can be used in an external magnetic field of 145 gauss or less.

This is equivalent to a magnetic field from a welding unit using a welding current of about 15,000 amperes, at a radius of approximately 18 cm . When operating in a magnetic field greater than this, the sensor unit should be shielded with a magnetic material.
5. Switches or relays, etc. should not be installed in the power supply line (12 to 24VDC).

## Effects of Noise

## Caution

When the scale cylinder is used near a motor, welding machine or other source of noise generation, there is a possibility of miscounting. In this case, noise should be suppressed as much as possible and the following countermeasures should be taken.

1. Connect the shield wire to FG (frame ground).
2. The maximum transmission distance for the scale cylinder is 23 m , but since the output signal is a pulse output, the sensor cable should be wired separately from other power lines.

* When using SMC extension cable and counter.

## Noise Countermeasures for the Scale Cylinder

Methods of dealing with noise are given below.

1. Connect only the shield wire to FG (frame ground).
2. Use a power source separate from large motors and AC type valves, etc.
3. Run the scale cylinder's cable away from other power lines.
4. Install a noise filter in the 100VAC power line, and install a varistor in the DC power supply of the sensor cable.

## <Counting speed of counter>

When the speed of the scale cylinder is greater than the counting speed of the counter, the counter will miscount.
For the CE1 (when measuring to 0.1 mm ), a counter should be used with a counting speed of $10 \mathrm{kHz}(\mathrm{kcps})$ or more, and for the CEP1 (when measuring to 0.01 mm ) using 4 times input, a counter should be used with a counting speed of 50 kHz (kcps) or more.

## <Malfunction due to lurching and bounding>

When lurching or bounding occurs at the beginning or end of strokes, or due to other causes, the cylinder speed momentarily increases, and there is a possibility of exceeding the counting speed of the counter or the response speed of the sensor, thereby causing a miscount.
The product should be used under conditions such that lurching and bounding will not occur.

## The instruction manuals should be read before using the Series CEP1 high precision scale cylinder, CEU5 multi counter, Series CE1 scale cylinder and CEU1 3 point preset counter.
